1 Simulated GWAS

(a) β_i and SNP odds ratio

(b)

See `simulated_gwas.py`.

(c)

(d)

(e) Hyperparameters

1.0.1 $n = 10000, k = 100, m = 1000, s = 0.25$

test

1.0.2 $n = 1000, k = 100, m = 1000, s = 0.25$

1.0.3 $n = 100000, k = 100, m = 1000, s = 0.25$

1.0.4 $n = 10000, k = 100, m = 10000, s = 0.25$

1.0.5 $n = 10000, k = 100, m = 1000, s = 0.5$

1.0.6 $n = 10000, k = 100, m = 1000, s = 0.1$

2 Finding eQTLs

(a) Principle Components Analysis

(b) Finding eQTLs via Linear Regression

For every SNP x_i, we find the mean and variance (μ_i, σ_i^2) of the correlation coefficients r_{ij} that x_i has with expression of gene y_j. In this way, we are determining the "typical" contribution of SNP x_i to any gene. We then select the SNP and gene pairs (x_i, e_j) for which r_{ij} is statistically significant under the null hypothesis $H_0 : \rho_{ij} = \mu_i$ (i.e. contribution of x_i to y_j is typical).

To implement the Bonferroni correction, we test each hypothesis that SNP x_i contributes to the expression of gene y_j with significance of $\alpha/5000$, where $\alpha = 0.05$ (since we are testing 5000 different genes corresponding to 5000 different hypotheses).

(c) Additional Datasets

3 Convolutional Neural Networks

(a) Implementation

```python
#!/usr/bin/env python

from keras.models import *
from keras.layers import *
import keras

import numpy as np
